FreeWire Technologies Inc.

REVISED EMC TEST REPORT TO 103944-6

Boost Charger*
Model: 160kW*
(*See Appendix A for Manufacturer Declaration)

Tested to The Following Standards:

FCC Part 15 Subpart B Section 15.107 & 15.109

Report No.: 103944-6A

Date of issue: September 28, 2020

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Test Certificate # 803.01

This report contains a total of 39 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

FreeWire Technologies Inc. 1933 Davis St. Suite 301A San Leandro, CA 94577	Kim Romero CKC Laboratories, Inc. 5046 Sierra Pines Drive Mariposa, CA 95338
Representative: Shawn Sullivan	Project Number: 103944
DATE OF EQUIPMENT RECEIPT:	March 23, 2020
DATE(S) OF TESTING:	March 23, 2020 and April 2-3, 2020

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the equipment provided by the client, tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Revision History

Original: Testing of Boost Charger, Model: 160kW to FCC Part 15 Subpart B Section 15.107 & 15.109.
Revision A: Added statement to Conditions Under Test table for clarification of testing setup.

Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart B

Test Procedure	Description	Modifications	Results
15.107 Class A	Conducted Emissions	Mod. #'s 1, 2, 3 and 4	Pass
15.109 Class A	Radiated Emissions	Mod. #'s 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 and 16	Pass

ISO/IEC 17025 Decision Rule
The declaration of pass or fail herein is based upon assessment to the specification(s) listed above, including where applicable, assessment of measurement uncertainties. For performance related tests, equipment was monitored for specified criteria identified in that section of testing.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
Modification 1: Added 2 capacitors (cap value for 1 = 2.2µF) model 2E225 in parallel, which were installed from the AC input filter on all 4 phases Line to Ground. (for a total of 8 caps total, two on each line.) Ferrites installed during time of test **Modification 2:** Heat exchanger fan cable had ferrite (KGS Model: KRFC-9) installed directly against the power output connector. **Modification 3:** High voltage sense line had 2 ferrites installed 1" away from each end with both ends having a double wrap around the core of the ferrite. (KGS Model: KRFC-9) **Modification 4:** Display power cable had a single ferrite installed directly up against the connector under the display. This ferrite had a double wrap around the core of the ferrite. (KGS Model: KRFC-9) **Modification 5:** DC to DC converter Input lines had one on each right near the connector. (KGS Model: RFC-20) **Modification 6:** Top shelf main harness has three ferrites installed on the DC power lines, one installed around the whole bundle about four inches back from the connector, one on the positive lines next to the connector and one on the negative lines connecting to the board. (Wurth Electronics Model: 742 712 11) **Modification 7:** Circulating fans connector had a double wrap of Ferrite placed as close to the end connector as possible. (KGS Model: KRFC-9)

Modification 8: Battery power lines had 4 (KGS Model: RFC-20) ferrites installed. Ferrites were installed 1 inch from both ends of each cable.

Modification 9: Shielded charge output cables connecting the shield to the chassis ground. Both ends of the shield were tied to the chassis. This shielded section of cable went from the DC to DC filter output and was routed as far away from the DC to DC filter input lines as possible. The shield did not extend outside the EUT.

Grounding straps were added from
Modification 10: Power Cube to Battery Cube

Modification 11: Power Cube to Door

Modification 12: Power Cube to Side Panels

Modification 13: Power Cube to Filter Plate

Modification 14: Chassis of the EUT has to be earth grounded.

Modification 15: Filter plate was replaced from one that was anodized with black paint to one that was clear coated.

Modification 16: EUT display was removed and the black anodized paint was masked/removed around the bezel and mounting hardware to ground to the chassis.

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
E-stop and Ethernet cables were installed as intended for final installation during testing.

EQUIPMENT UNDER TEST (EUT)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 1

Equipment Tested:

Device	Manufacturer	Model #	S/N
Boost EV Charger	FreeWire Technologies, Inc.	11	3

Support Equipment:

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 1			

Test Conditions / Notes:

Frequency Range of Interest: 150kHz-30MHz
RBW = 9kHz; VBW > RBW

Environmental Conditions:
Temperature: 15.9°C
Relative Humidity: 61.3%
Atmospheric Pressure: 101.2kPa

Highest Internal Clock frequency: 800MHz

The EUT is a battery-integrated DC charger. It has two identical DC output power circuits which support CCS and CHADeMO. During testing the CHADeMO charger was holstered, the POS terminal was bypassed. For the purpose of this test, the boost charger is connected to a 208VAC 4 Wire power source. The CCS output is connected into the load bank. The CCS output is programmed to deliver 150A at 400V.

Test Method: ANSI C63.4: 2014

Modifications 1, 2, 3 and 4 were in place during testing.

Test Location:	CKC Laboratories, Inc. • 5046 Sierra Pines Drive • Mariposa, CA 95338 • (209) 966-5240		
Customer:	**FreeWire Technologies Inc.**		
Specification:	**15.109 Radiated Emissions Class A**		
Work Order #:	**103906**	Date:	4/3/2020
Test Type:	**Maximized Emissions**	Time:	09:54:29
Tested By:	Michael Rauch Jr.	Sequence#:	2
Software:	EMITest 5.03.12		

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 1			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 1			

Test Conditions / Notes:

Frequency Range of Interest: 1000-5000MHz
RBW = 1MHz; VBW > RBW

Environmental Conditions:
Temperature: 14.2°C
Relative Humidity: 47.2%
Atmospheric Pressure: 101.1kPa

Highest Internal Clock frequency: 800MHz

The EUT is a battery-integrated DC charger. It has two identical DC output power circuits which support CCS and CHADeMO. During testing the CHADeMO charger was holstered, the POS terminal was bypassed. For the purpose of this test, the boost charger is connected to a 208VAC 4 Wire power source. The CCS output is connected into the load bank. The CCS output is programmed to deliver 150A at 400V.

Test Method: ANSI C63.4: 2014

Modifications 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 and 16 were in place during testing.

Appendix A: Manufacturer Declaration

The following device/model has been tested by CKC Laboratories:
Device: Boost EV Charger
Model: 11

Since the time of testing, the manufacturer has chosen to use the following device/model name in its place.
The manufacturer declares that any differences between the names does not affect their EMC characteristics and therefore meets the level of testing equivalent to the tested model name:
Device: Boost Charger
Model: 160kW

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBµV)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBµV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
